Concluding remarks

- Spatial income inequalities spectacularly grew after the political transition,
- Three stages can be detected by the national inequality trends:
 - stage of rapid growth until the mid 1990's;
 - stage of high level stagnation until the millennium;
 - stage of moderate convergence.
- However, there are considerable differences regarding the regional trends;
- The pattern of economic recession after the political transition reflects income polarization according to the local core-periphery relations;
- This pattern tends to stagnate or become even more polarized in the case of backward areas with economy unable to recover.
